

There are different background properties. One property is the background-image in which you refer to a url link to cover the background of your element. Background-color modifies color of element's background. Background-repeat defines if image's repeat. Background position adjust alignment of background image. Background size defines how image fits inside the element. Background attachment controls if the image scrolls with the page. For my website, i set the background image to a particular landscape. I created a div too in the bottom which has its own background image and other background properties
